

TENDER PINK PASSION FOR AESTHETICS

Tender Pink is the most innovative system to reproduce the gingival tissue in dental office and laboratory.

4 shades: Pink Dark, Pink Light, Pink Orange, Pink Transparent.

The chromatic effect can be enhanced by use of Stain Flow Blue, White, Red and Violet that can be also mixed between them.

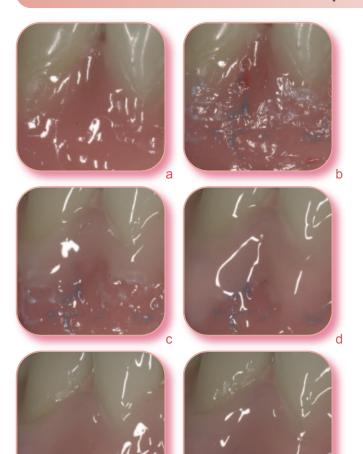

Gum characterization in removable and implant prosthesis

- a. Temp Bonding Fluid allows the adhesion of methyl methacrylate resin to light curing composite.
- b. Stain Flow White increases the opacity and shade of ischemic papilla or in bone prominence area, Stain Flow Red increases the chromaticity of pink composite, simulating veins, Stain Flow Blue increases effects in foramen and small veins. New Stain Flow Violet is ideal for reproduction of veins in deep gingival and can increase the chromaticity of Tender Dark composite, by mixing them together.
- c. Tender Pink **Transparent** reproduces the cervical area where the gum cover the tooth and not the bone. In combination with White or Red Stain is used to reproduce the frenum shade that differs from gingival shades.
- d. Tender Pink **Light** reproduces the area over the root where the gum is tight and transparent.
- e. Tender Pink **Dark** reproduces area of the gum less thigh and less adherent to the bone, highly blood supplied with a red blue shade in the area of the foramen. In combination with Stain Blue and Red the colour of the veins of the natural gum can be enhanced.
- f. Tender Pink **Orange** (available also as **Flow**) is used as first layer or combined with Stain Flow White reproduces the typical colour of bone prominence of natural flanges.
- g. Tender Pink **Opaque**, that contains also the primer, is used to mask the metal structure.
